Want some more data? [Paying accounts](#) get pretty charts :)

Code:

What your site is running:

Source code: [/home/Pmorales/Lab\\_Bago/](#) [Go to directory](#)  
Working directory: [/home/Pmorales/](#) [Go to directory](#)  
WSGI configuration file: [/var/www/pmorales\\_pythonanywhere\\_com\\_wsgi.py](#)  
Python version: 3.10

Virtualenv:

Use a [virtualenv](#) to get different versions of flask, django etc from our default system ones. [More info](#) here. You need to [Reload your web app](#) to activate it; NB - will do nothing if the virtualenv does not exist.

[/home/Pmorales/Server](#)  
[Start a console in this virtualenv](#)

Log files:

The first place to look if something goes wrong.

Access log: [pmorales.pythonanywhere.com.access.log](#)  
Error log: [pmorales.pythonanywhere.com.error.log](#)  
Server log: [pmorales.pythonanywhere.com.server.log](#)

Log files are periodically rotated. You can find old logs here: [/var/log](#)

Static files:

Files that aren't dynamically generated by your code, like CSS, JavaScript or uploaded files, can be served much faster straight off the disk if you specify them here. You need to [Reload your web app](#) to activate any changes you make to the mappings below.

URL	Directory	Delete
<a href="#">/static/</a>	<a href="#">/home/Pmorales/Lab_Bago/static/</a>	
<a href="#">Enter URL</a>	<a href="#">Enter path</a>	

Security:

An HTTPS certificate is needed so that people can access your site securely. We automatically provide a certificate for [pmorales.pythonanywhere.com](#).

HTTPS certificate: Automatically provided for this hostname
